Cover image: Gastric cancer is one of the most common malignancies of the gastrointestinal tract with high morbidity and mortality rates, and identification of effective diagnostic and prognostic biomarkers can greatly facilitate its treatment. FJX1 is highly expressed in gastric cancer tissues and causes activation of the PI3K/AKT pathway to promote tumor cell proliferation and cancer progression, suggesting its potential as a promising therapeutic target for gastric cancer. Provided by ZHANG Hao (Department of Gastrointestinal Surgery, First Affiliated Hospital of Bengbu Medical College). See full-text article on page 975-984 in this issue.
