On the page 1653, Le et al developed a method to enrich phosphorylated peptides by titanium dioxide affinity chromatography, of which the phosphorylation sites were further analyzed by LC - MS/MS. By taking 14-3-3 $\epsilon$  protein over-expressed in HEK293 cells as an example, twelve phosphorylation modification sites within 14-3-3 $\epsilon$  protein were identified.

### ★ Application of Dendrimer in Analytical Chemistry

FU Cong, LI Jian-Ping\*

*Chinese J. Anal. Chem.*, 2013, 41(11): 1762–1772

Dendrimers are a new type of macromolecules that could be synthesized by deliberate design and repeated procedures. They have hyperbranched structure, a lot of space inside and multiple functional groups on the surface of the nanosphere. As for now, there have been many reports about the applications of dendrimers. This review primarily focuses on their applications in analytical chemistry, and introduce several applications published recently.

An analytical method using inductively coupled plasma atomic emission spectroscopy (ICP-AES) for the rapid and accurate determination of Si, Fe, Mn, Mg in sponge titanium was investigated. Samples were decomposed with HF and HNO<sub>3</sub>. The instrument equipped with a nebulizer and a torch made from HF resisting material was used for the direct determination, which made the pretreatment more convenient and with less interference.

*Chinese J. Anal. Chem.*, 2013, 41(11) : 1784-1785

A dialysis-GFAAS method was established for the determination of small molecular soluble protein binding copper (DiaCu) in tissue. The method was applied to determine the DiaCu in endotoximia SD rats induced by lipopolysaccharide (LPS), and it was found that the DiaCu concentration decreased in inflammatory tissue.
