On page 702-709, Zhang et al. designed a visual test paper for convenient and fast detection of telomerase activity. The test paper was based on the lateral flow technology and the hybridization between the telomerase-elongated products and the capture DNA on the paper, and the results were indicated by the color development of gold nanoparticles. The developed method here could be used for the sensitive detection of telomerase elongated-products at low concentration and the visual differentiation between extracts from cancerous cells and normal cells.
