ON THE COVER

Energy is vital to any modern economy because it underpins human wellbeing and economic productivity. In recent years, a great deal of engineering research has focused on designing low-carbon, or “clean,” energy systems. A clean energy future will grant the rising global population access to reliable, affordable, and sustainable energy services without contributing to climate change. Transitioning our fuel mix away from coal and oil and toward natural gas and renewable energy will take time, as the energy industry progresses through a period of profound change. Effective government policies and considerable technological progress are being made in the transition from fossil fuels to ecologically sustainable energy systems, such that many studies support future energy systems based on 100% renewable energy.

Green Chemical Engineering—Review

封面说明

能源对任何现代经济制度都至关重要，因为它支撑着人类福祉和经济生产力。近年来，大量的工程研究集中在低碳、清洁能源系统的设计上。未来清洁能源将在不造成气候变化的前提下，为不断增长的全球人口提供可靠、可负担得起和可持续的能源服务。随着能源工业在一个深刻变革时期的发展，燃料结构将逐渐从煤炭和石油转向天然气和可再生能源。在从化石燃料过渡到生态可持续能源系统的时期，有效的政府政策正在实施，并取得了巨大的技术进步，如许多研究支持基于 100% 可再生能源的未来能源系统。

Engineering Science and Technology

Create a Better Future

Efficient mining and utilization of deep mineral resources is the most pressing problem facing the exploitation of mineral resources in China. Deep mining involves a series of technical problems caused by high stress, high well temperature, high osmotic pressure, the deterioration of geological and mining conditions, and so forth. To maximize safety and efficiency in the exploitation and utilization of mineral resources, we must build a new selection mode and technical system that is more efficient, less expensive, safer, and more environmentally friendly.

Engineering is intended to provide a high-level platform

where academic achievements of great importance

in engineering science and technology

can be disseminated and shared.
