- Continually Improve the Communication Mechanisms of the Food Security Risk in China *Li Gen and Li Xiangyang*

ABSTRACTS OF SELECTED ARTICLES**An Estimation of the Capital Stock and Technological Progress Rates in Chinese Cities: 1992-2014***Xu Shudan*

This paper estimated the national, provincial and urban capital stocks and depreciation rates in China under a uniform framework by improving the perpetual inventory method. Besides, the current paper implemented Cobb-Douglas production function and panel data models to measure technological progress rates of Chinese cities, therefore investigated the provincial and urban technological changes. The results showed that: (1) A uniform estimation framework ensured reliability of the capital stock and depreciation rate estimations; (2) There was a decreasing trend of the depreciation rates in China since 2008; (3) Average provincial technological progress had a convergent tendency to that of central and east areas in China, while the technological progress rates had little difference; (4) The technological progress of major cities maintained higher level than provincial average, and the potential technological advantages of provincial capitals failed to be found, indicating that urban technological progress may have closer relationship with the local economic efficiency, the interaction with peripheral regions and the investment on the technological and innovative constructions.

**Chinese Short Selling Mechanism and Corporate Innovation:
A Natural Experiment from Chinese Margin Trading Program**

Quan Xiaofeng and Yin Hongying

Based on a natural experiment of the stock distribution expansion in China's margin trading and the difference-in-difference models, this paper systematically examines the effect of short selling on innovative behavior of companies and its value mechanism. The study finds that the implementation of margin trading program does not significantly affect the corporate investment in innovation, but significantly improves the corporate innovation output, which shows that the margin trading program has an innovation incentive effect that can significantly enhance corporate innovation efficiency. Secondly, the "innovation incentive effect" of the margin trading programs are stronger in informa-
