Employment Structure, Intermediate Inputs and China's "Mystery of Changes in Export Product Quality"

Liu Qiren and Tie Ying

The proportion of Chinese enterprises hiring college students has increased in recent years, but export product quality has not improved significantly, forming the so-called "mystery of changes in export product quality". This paper introduces heterogeneous "employment structure" of enterprise into Hallak&Sivadasan (2013) model, explores the relationship between labor input and export product quality, and attempts to combine complementarity of enterprise skill inputs and intermediate product input quality to explain "mystery of change in export product quality". Using economic census, industrial enterprises and customs matching data, we find that: (1) employment structure upgrade has a positive promotion effect on export product quality; (2) employment structure and company's intermediate input quality are complementary, and the higher the intermediate input quality, the stronger the promotion effect of employment structure on export product quality; (3) the observed "mystery of changes in export product quality" is partly due to the large decrease in the proportion of imported intermediate product leading to the decline of intermediate input product quality, and the effect of the upgrade of the employment structure on the quality has been dragged down by the decline in the intermediate input product quality, and it has not fully exerted its due quality upgrade effect. In short, during the critical stage of "a major trading country moving towards a strong trading country", although the growth in the supply of highly educated labor force will help improve Chinese product quality, this process urgently needs corresponding high-quality intermediate product inputs. Therefore, further promoting the liberalization of trade in intermediate products and the supply capacity of domestic intermediate products are important means to solve the problem of quality upgrade.

Disadvantages of Original Country and Legitimacy Strategies:

Case Studies on EMNEs' Cross-border M&A

Wei Jiang, Wang Ding and Liu Yang

Facing liabilities of country of origin, how do emerging market firms choose legitimacy strategies during cross-border M&As? Studying six cross-border M&As of Geely and Wanxiang, we propose that the concept of liability of country of origin includes two dimensions, namely, product-related liabilities and institution-related liabilities. Moreover, we find that facing product-related liabilities, emerging market firms would prefer the legitimacy repairing strategies. In contrast, facing institution-related liabilities, emerging market firms would prefer the legitimacy acquir-
