On the cover: A nano-iron reactor is applied to recover silver from aqueous solution. Experimental results demonstrate that nanoscale zero-valent iron could sequester Ag^+ (*ca.* 1 mg/L) and be transformed into high-grade (32.0 mg/g) silver “ore”, with valuable silver nanoparticles produced. The performance of the “reaction-separation-reuse” system can be easily regulated with the oxidation reduction potential in reaction zone. [Zhang, Wei-xian *et al.* on page 991-997.]

Peptide Supramolecular Self-Assembly: Structural Precise Regulation and Functionalization

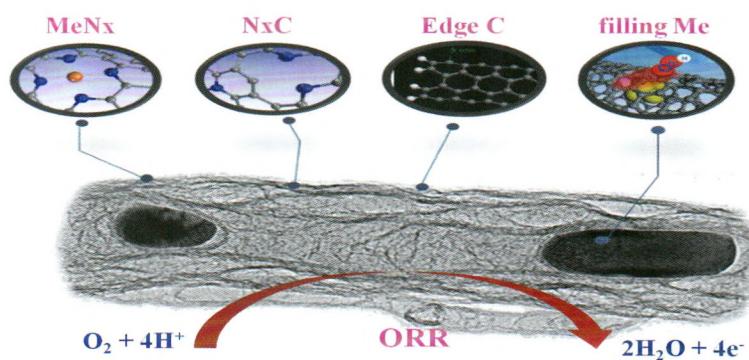

Wang, Juan; Zou, Qianli; Yan, Xuehai*

Acta Chim. Sinica 2017, 75(10), 933-942

The reasonable regulation of various non-covalent interactions by specific and precise molecular design is favorable to achieve the structural precise regulation and functionalization.

A Review of Carbon-based Non-noble Catalysts for Oxygen Reduction Reaction

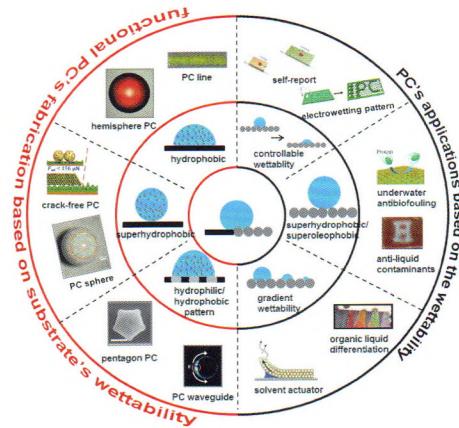

Zhong, Guoyu; Wang, Hongjuan; Yu, Hao; Peng, Feng*

Acta Chim. Sinica 2017, 75(10), 943-966

A series of carbon-based non-noble catalysts for oxygen reduction reaction (ORR) are introduced, the ORR catalytic active sites including transition metal-nitrogen-carbon (MeN_x), nitrogen-doped carbon (N_xC), edge carbon and filling transition metal are summarized and discussed.

Research Progress on the Superwettability of Colloidal Photonic Crystals

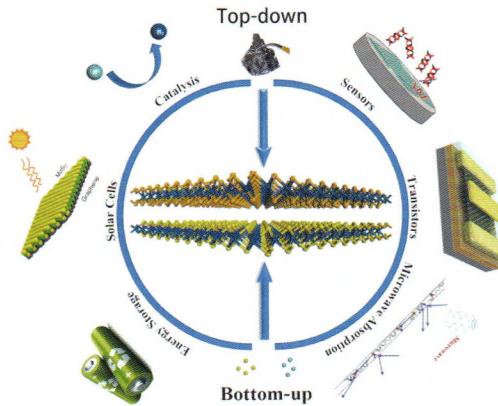

Cui, Liying; Fan, Shasha; Yu, Cunlong; Kuang, Minxuan; Wang, Jingxia*

Acta Chim. Sinica 2017, 75(10), 967-978

The fabrication of functional colloidal photonic crystal (PC) was presented from the modification of its wettability (superhydrophilic, superhydrophobic, amphiphilic, gradient wettability, controllable wettability and patterned wettability), and the self-assembly of functional colloidal PC by using the substrate with special wettability (hydrophobic, superhydrophobic or hydrophilic-hydrophobic pattern).

Research Progress on Preparation and Application of Two-Dimensional Transition Metal Dichalcogenides Nanomaterials

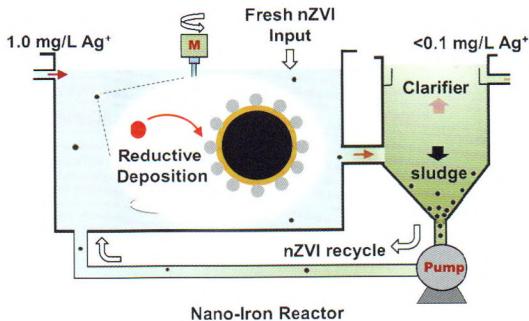

Lin, Xiaoyu; Wang, Jing*

Acta Chim. Sinica 2017, 75(10), 979-990

Two-dimensional transition metal dichalcogenides (TMDCs) are new types of graphene-like materials. TMDCs can be prepared by top-down or bottom-up methods, and have a wide range of applications in transistors, sensors, microwave absorption, catalysis, solar cells and energy storage.

Enrichment of Silver from Water Using Nanoscale Zero-Valent Iron (nZVI)

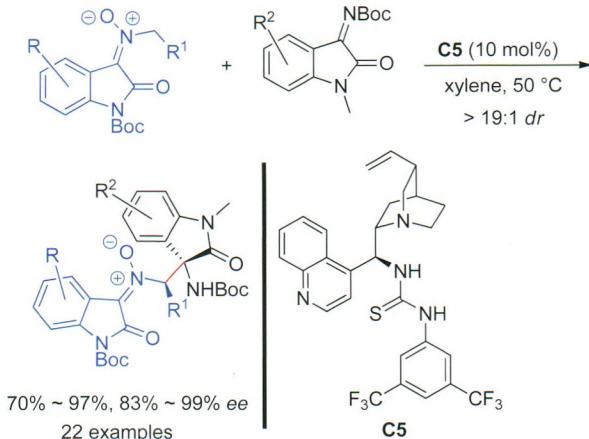

Gu, Tianhang; Shi, Junming; Hua, Yilong; Liu, Jing; Wang, Wei*; Zhang, Wei-xian*

Acta Chim. Sinica 2017, 75(10), 991-997

Enrichment of silver using nanoscale zero-valent iron (nZVI) is feasible and controllable. Results of continuous flow experiments show that the silver content in products is up to 32.0 mg/g, higher than that of natural silver ore. Results of solid phase characterization demonstrate that Ag⁺ is reduced to metallic silver (Ag⁰), and deposits on iron surface in the form of spherical nanoparticle (ca. 10 nm).

Direct Asymmetric Aza-Vinylogous Mannich Reaction of Nitrones from Isatins and Ketimines

Preparation of Crack-free Inverse-opal Films by Template/Matrix Co-assembly

The $\text{MnO}_2/\text{rGO@Ni}$ foam electrode is prepared by two-step hydrothermal methods with large surface area and outstanding electrocatalytic activity toward H_2O_2 reduction.

Luo, Wenhao; Zhu, Shuihong; Lin, Youhui*;
Liu, Xiang Yang*

Acta Chim. Sinica 2017, 75(10), 1010-1016

The feasibility of using template/matrix co-assembly strategies to fabricate crack-free inverse opal thin films was examined. The SEM results show that such a co-assembly strategy can fabricate large-scale crack-free inverse opal films for TEOS matrix precursor but not suitable for regenerated silk fibroin matrix.
