## Contents

**On the cover:** A new N-type ferrimagnet  $[\text{CH}_3\text{NH}_3]_2[\text{Fe}^{\text{II}}\text{Fe}^{\text{III}}(\text{HCO}_2)_6]$  shows large negative magnetization below  $T_N$  on cooling under the applied field even at 1 T. Further positive field regulated switchable magnetic dipoles switching of the magnetization and obvious huge positive exchange bias is also observed in the complex. [Bu, Xianhe *et al.* on page 1223-1228.]

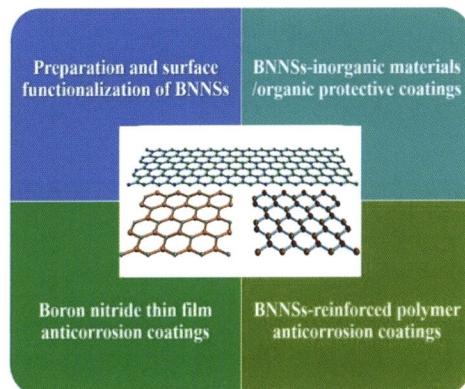

**On the back cover:** A pH-responsive poly(ethylene glycol)-*b*-poly(*L*-lysine)-*b*-poly(styrene) (PEG-*b*-PLL-*b*-PS) triblock copolymer forms spherical micelles, which are further used as the sub-units to construct hierarchical 1D fiber-like supramolecular structure in water-THF mixed solvent. [Sun, Jing *et al.* on page 1235-1239.]

## Synthesis of A Novel Anti-diabetes Chromium(III) Complex and Investigation of Its Biological Activity and Mechanism

The diagram illustrates the structural transformation of silver clusters. On the left, a complex framework is shown composed of yellow, red, and green polyhedra. An arrow points to the center, where two structures are depicted: an  $\text{Ag}_{14}$  dodecahedron (left) and an  $\text{Ag}_{14}$  spindle-shape (right). The dodecahedron has a  $\text{C}_h$  axis and edge lengths of 0.679 nm. The spindle-shape has a  $\text{C}_h$  axis and edge lengths of 0.607 nm. An arrow labeled "isomerization" indicates the transition between these two forms. A final arrow points to the right, leading to a complex framework composed of the same yellow, red, and green polyhedra as the starting material.

The deformation of  $\text{Ag}_{14}$  core from dodecahedron to spindle shape causes the spherical silver(I)-thiolate cluster  $\text{Ag}_{56}$  to change to spindle-shaped  $\text{Ag}_{58}$  cluster.
