	Quantitative risk assessment of oil tanker collision accident
	Tu Yan, Ren Huasheng, Jia Qin(1)
crude oil pollution. dent, in recent year model of ship collisio oil and puts forward	that, ship (especially the oil tanker) collision accident not only cause huge economic losses, but also one of the main reasons of ocean As a kind of risk assessment method, quantitative risk assessment technology can scientifically forecast probability and damage of the accis, has gained widespread attention in ship and ocean engineering field. Based on P. T. Pedersen collision model, a math calculation on accident is established and the probability of ship collision accident is calculated in the paper. The paper analyses the diffusion of spilled the measures to reduce ship collision by using DNV risk assessment software Neptune.
JS 2013-4-02	Application of spectrum of a graph design in a offshore ship duct propeller rudder
The paper design formance prediction cal thrust prediction JS 2013-4-03	Chen Tingting, Qiu Lihui (5) gas a duct propeller for a offshore ship by spectrum of a graph design method in a offshore ship duct propeller rudder, and give the per of real ship bitt thrust. Through duct propeller open water performance test it gives the open water performance curve, and gives the practical at bollard condition. Finally, the paper compares with the results of real ship trial and gives correlation conclusion. Analysis on temperature field and thermal stress of a 2 000 t inland river petroleum asphalical stress.

nite element model, search has a definite	petroleum asphalt ship as a research object, the paper adopts MSC/PATRAN and MSC/NASTRAN finite element software, establishing fi considering influence of temperature stress field, it analyzes two kinds of condition of the petroleum asphalt ship. The results of the reserverence significance for temperature field and thermal stress analysis of similar ship. Key Point of design on a 7 000 t product carrier
