² Shenzhen University, China

Recent advances in the underlying mechanism of two-dimensional nanomaterials (2DNMs)-photodynamic therapy (PDT), how to enhance tumor-killing efficacy, the preparation methods of 2DNMs and the classical reports of various kinds of 2DNMs were reviewed. With unique electronic structure and exceptional optical properties, 2DNMs are expected to conquer any obstacle in maximizing antitumor efficacy of PDT.

⁵ Shanghai Institute of Microsystem and Information Technology, Chinese Academy of Sciences, China

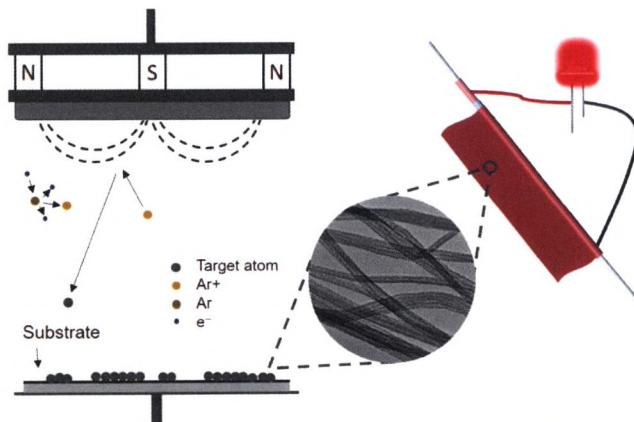

The crystal-plane-dependent oxidation and reduction processes were studied at the atomic scale by *in-situ* scanning tunneling microscopy (STM) on Cu surfaces.

1677–1685

A stretchable, asymmetric, coaxial fiber-shaped supercapacitor for wearable electronics

Hua Yuan, Guang Wang, Yuxing Zhao, Yang Liu, Yang Wu*, and Yuegang Zhang*

Tsinghua University, China

Nanomaterials deposited by magnetron sputtering were utilized for fabricating a stretchable, asymmetric, coaxial fiber-shaped supercapacitor with a high potential window of 1.8 V. The device demonstrated a high energy density of $4.7 \text{ mWh}\cdot\text{cm}^{-3}$ and superior performance under a strain up to 75%.

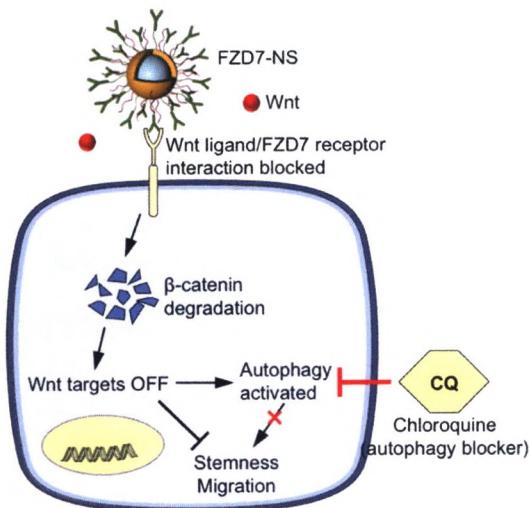

1686–1692

Inhibition of Wnt signaling by Frizzled7 antibody-coated nanoshells sensitizes triple-negative breast cancer cells to the autophagy regulator chloroquine

Jianxin Wang¹, Megan N. Dang¹, and Emily S. Day^{1,2,*}

¹ University of Delaware, USA

² Helen F. Graham Cancer Center & Research Institute, USA

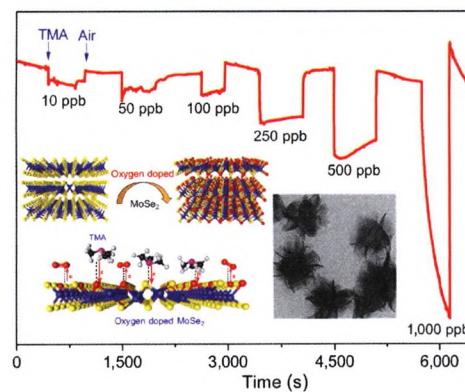

Nanoparticles that suppress Wnt signaling through antibody-mediated signal cascade interference sensitize triple-negative breast cancer cells to the autophagy inhibitor chloroquine.

1693–1703

Fabrication of oxygen-doped MoSe₂ hierarchical nanosheets for highly sensitive and selective detection of trace trimethylamine at room temperature in air

Nannan Hou, Qianqian Sun, Jing Yang, Su You, Yun Cheng, Qian Xu, Wei Li, Shiqi Xing, Li Zhang, Junfa Zhu, and Qing Yang*

University of Science and Technology of China, China

A novel kind of oxygen-doped MoSe₂ hierarchical nanosheets derived from pristine MoSe₂ ultrathin nanostructures was typically fabricated at 200 °C as treated in air and the nanosheets are capable for fast and sensitive ambient-condition detection of trace trimethylamine (TMA) with a theoretical limit of detection (LOD) of ~ 8 ppb, which is the lowest concentration for TMA detection up to date.

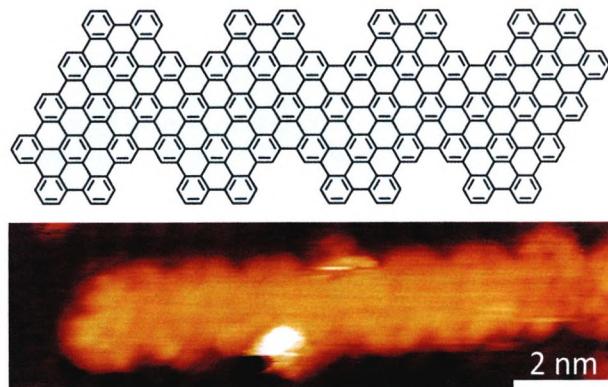

1704–1712

Chevron-type graphene nanoribbons with a reduced energy band gap: Solution synthesis, scanning tunneling microscopy and electrical characterization

Ximeng Liu¹, Gang Li², Alexey Lipatov², Tao Sun¹, Mohammad Mehdi Pour², Narayana R. Aluru¹, Joseph W. Lyding^{1,*}, and Alexander Sinitskii^{2,*}

¹ University of Illinois at Urbana-Champaign, USA

² University of Nebraska-Lincoln, USA

We report a detailed scanning tunneling microscopy characterization of solution-synthesized graphene nanoribbons deposited onto III-V semiconducting InAs(110) substrates. The ribbons were visualized with submolecular resolution, and their measured band gap of about 2 eV was very close to 2.35 eV predicted by the density functional theory (DFT) simulations with GW correction, indicating a weak screening effect of InAs(110) substrate.

1713–1722

Self-organization of various “phase-separated” nanostructures in a single chemical vapor deposition

Jinmei Wang^{1,6}, Dongyue Xie², Zhen Li^{1,t,*}, Xiaohang Zhang³, Xing Sun⁴, Amanda L. Coughlin¹, Thomas Ruch¹, Qiang Chen⁵, Yaroslav Losovyj¹, Seunghun Lee³, Heshan Yu³, Haidong Zhou⁵, Haiyan Wang⁴, Jian Wang², and Shixiong Zhang^{1,7,*}

⁴ Purdue University, USA

⁵ University of Tennessee, USA

⁶ Chongqing University of Posts and Telecommunications, China

⁷ Rice University, USA

* Present address: RIKEN Center for Advanced Photonics, Japan

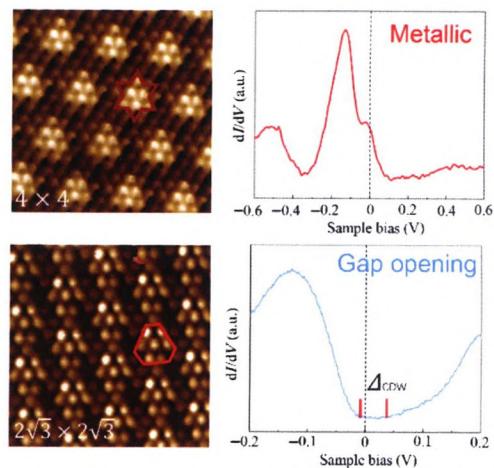

We achieved the self-assembly of phase-separated nanostructures including Si/SiO_x core-shell nanowire heterostructures both with and without embedded manganese silicide particles, Mn₁₁Si₁₉ nanowires, and SnTe nanoplates from a single chemical vapor deposition. The “phase-separation” is well understood based on thermodynamic analysis and density functional theory calculations.

1749–1755

A near-infrared (NIR) responsive PtPd-ethylene glycol (PEG)-folic acid (FA)-doxorubicin (DOX) mesoporous nanoparticle was fabricated to achieve active-targeted imaging-guided chemo-photothermal therapy of breast cancer. NIR irradiation could not only induce the hyperthermia to kill tumor cells, but also promote the release of DOX to trigger synergistic therapeutic effect. With high DOX loading capacity, excellent photoacoustic (PA) imaging/photothermal therapy (PTT) effect as well as active targeting function, our nanoplatform is a promising candidate for PTT/chemotherapy in tumor treatment application.

Four-parameter metrology: The overall quality of carbon nanotube thin films is thoroughly characterized by a four-parameter metrology, which includes the local tube density (D_L), global density uniformity (C_v), local degree of order (O_L), and the relative tube proportion in a certain orientation (P_{θ}) at a location. This four-parameter metrology will speed up the development of carbon nanotube-based transistor technology.

Nanoliposome-encapsulated caged-GABA for modulating neural electrophysiological activity with simultaneous detection by microelectrode arrays

Erratum to: Conformal and continuous deposition of bifunctional cobalt phosphide layers on p-silicon nanowire arrays for improved solar hydrogen evolution (<https://doi.org/10.1007/s12274-018-2070-4>)

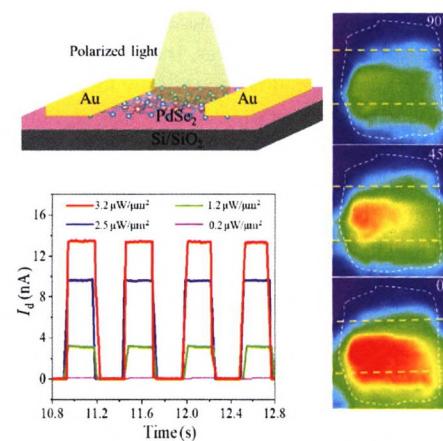

1787

This article presents a novel and promising strategy to modulate neural signals using RuBi-GABA encapsulated in nanoliposomes (Nanolipo-Ru) with real-time monitoring by the microelectrode array (MEA) in the rat.

An electrical model was developed to describe the electronic transport in carbon nanotube (CNT)-based materials. Our model successfully fits the literature data and highlights the role played by different mechanisms (Luttinger Liquid, metallic and semiconducting behaviors) depending on the temperature range (3–300 K) and on the fabrication technique (floating catalyst carbon nanotube yarns or carbon nanotube array yarns). It appears that the CNT growth control is much more important than the fabrication technique to allow for high electrical conductivity CNT yarns.

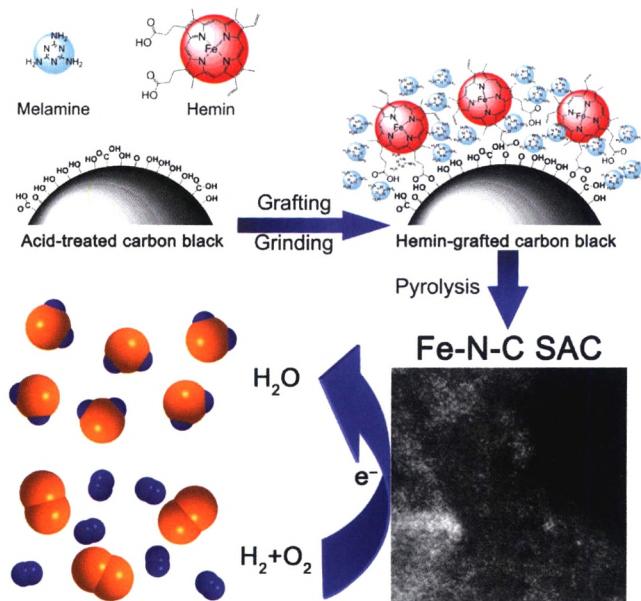

The competitive capability to detect polarized light with a significant photocurrent on/off ratio ($> 10^2$), the quite fast response time ($< 11 \text{ ms}$) and robust linearly dichroic ratios ($I_{\max}/I_{\min} \approx 1.9$ at 532 nm) was realized in the 5L-PdSe₂-based photodetector.

Facile grafting strategy synthesis of single-atom electrocatalyst with enhanced ORR performance

Rui Ding, Yide Liu, Zhiyan Rui, Jia Li*, Jianguo Liu*, and Zhigang Zou

Nanjing University, China

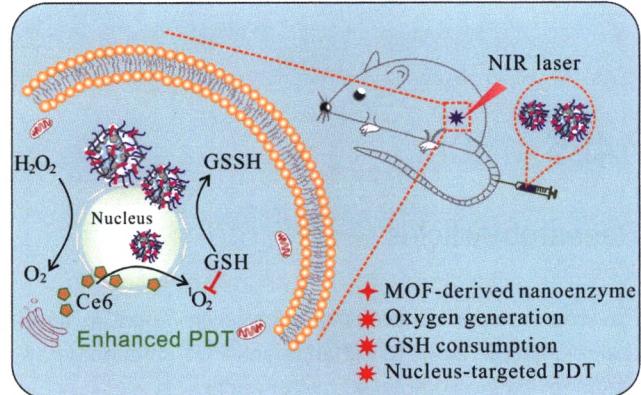

A Fe-N-C single-atom electrocatalyst is synthesized by facile grafting strategy. Chemical bonds between hemin and carbon substrate are achieved by esterification process and melamine which serves as blocking agent and help to suppress aggregation against high temperature during pyrolysis, and thereby directly construct abundant atomically dispersed Fe-N₄ actives with enhanced oxygen reduction reaction (ORR) catalytic performance in acid condition.

1519–1526

Modulation of tumor microenvironment by metal-organic-framework-derived nanoenzyme for enhancing nucleus-targeted photodynamic therapy

Xuemei Zeng, Shuangqian Yan, Peng Chen, Wei Du, and Bi-Feng Liu*

Huazhong University of Science and Technology, China

This work uses metal-organic framework (MOF)-derived nanoenzyme for improving nucleus-targeted photodynamic therapy by modulation of the tumor microenvironment. It may provide a new approach for designing functional nanoenzyme to subcellular organelles-targeted tumor modulation.

1527–1535

Understanding the role of interface in advanced semiconductor nanostructure and its interplay with wave function overlap

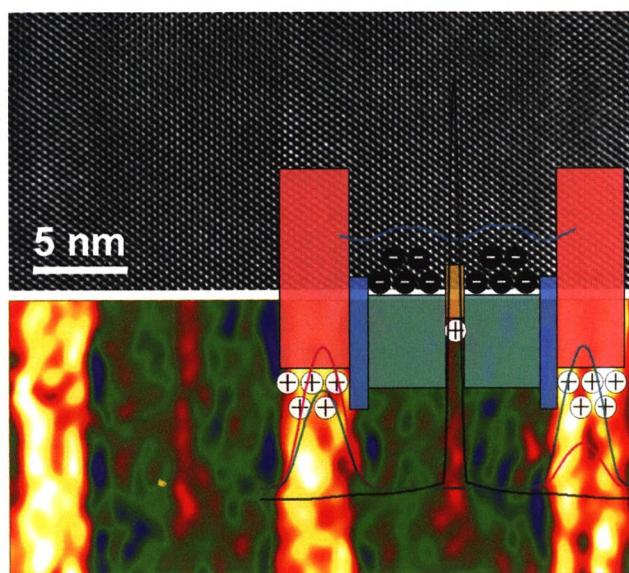

Chenyuan Cai¹, Yunhao Zhao¹, Faran Chang², Xuebing Zhao¹, Liting Yang¹, Chongyun Liang¹, Guowei Wang², Zhichuan Niu², Yi Shi³, Xianhu Liu⁴, Yuesheng Li¹, and Renchao Che^{1,*}

¹ Fudan University, China

⁴ Zhengzhou University, China

The effect of interface is explored by comparatively studying two InAs/AlSb superlattices with and without the thin InAsSb layers inserted inside each InAs layers. It has been verified that the addition of InAsSb layers could enhance electron-hole wave function overlap by both theoretical simulations and experimental analysis, which is a premise for better device performance.

1536–1543

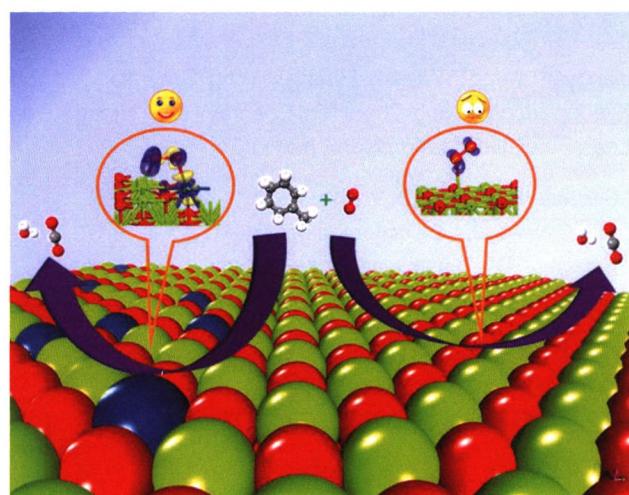

Formation of active oxygen species on single-atom Pt catalyst and promoted catalytic oxidation of toluene

Shunzheng Zhao^{1,2}, Yanfeng Wen¹, Xijun Liu^{3,*}, Xianyun Pen³, Fang Lü³, Fengyu Gao¹, Xizhou Xie¹, Chengcheng Du¹, Honghong Yi^{1,2,*}, Dongjuan Kang^{1,*}, and Xiaolong Tang^{1,2,*}

¹ University of Science and Technology Beijing, China

² Beijing Key Laboratory of Resource-oriented Treatment of Industrial Pollutants, China

³ Tianjin University of Technology, China

Single-atom Pt anchored on MgO nanosheets (Pt SA/MgO) were synthesized for toluene oxidation. It is more favorable for the formation of oxygen vacancies, which facilitate O₂ activation and generation of primary active oxygen species ·O. With the assistance of H₂O, ·O is easier to be dissociated to generate ·OH on oxygen vacancies, which is dominant active species for toluene oxidation.

1544–1551

Step-confined thin film growth via near-surface atom migration

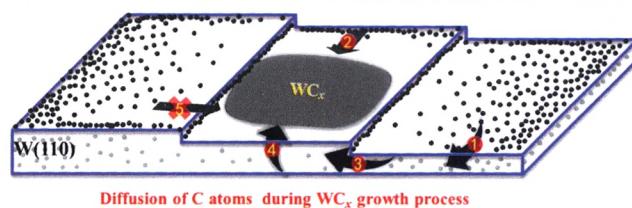

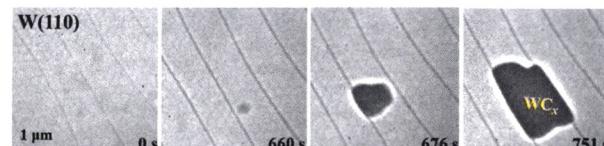

Caixia Meng^{1,2}, Junfeng Gao³, Rongtan Li^{1,2}, Yanxiao Ning¹, Yuan Chang³, Rentao Mu^{1,*}, Qiang Fu^{1,*}, and Xinhe Bao^{1,4}

³ City University of Hong Kong, Hong Kong, China

This report introduces a dual-functionalized (aminated, PEGylated) porous silica nanoparticle system which could be conjugated with different molecules for versatile tracking of bacteria and cancer cells in one step.

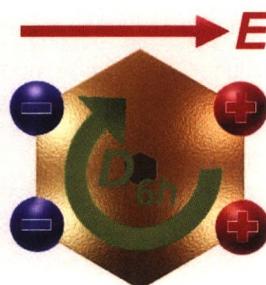

1592–1596

Plasmonics of regular shape particles, a simple group theory approach

Sarra Mitiche[†], Sylvie Marguet, Fabrice Charra, and Ludovic Douillard^{*}

CEA, CNRS, France

[†] Present address: Centrale Supelec, CNRS, France

A simple group theory method is proposed to describe the plasmonic response of particles of finite or infinite symmetry point groups.

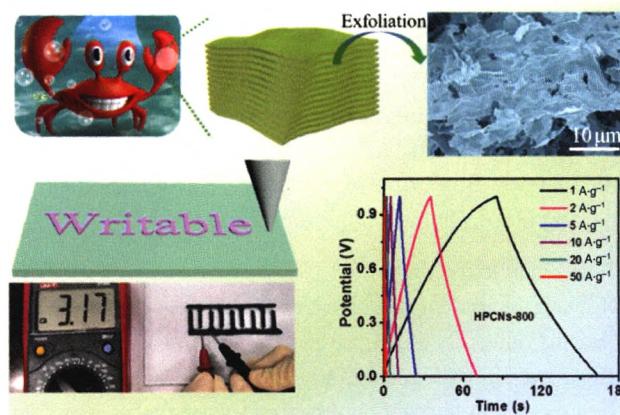

1597–1603

Rationally exfoliating chitin into 2D hierarchical porous carbon nanosheets for high-rate energy storage

Lingfeng Gao¹, Guoqun Zhang², Jie Cai¹, Liang Huang^{2,*}, Jun Zhou², and Lina Zhang^{1,*}

¹ Wuhan University, China

² Huazhong University of Science and Technology, China

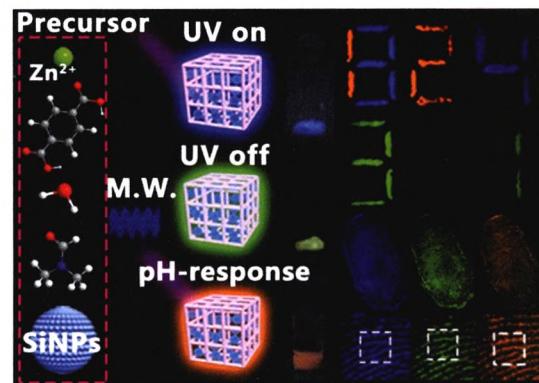

Two-dimensional (2D) hierarchical porous carbon nanosheets with abundant N/O/P doping were massively fabricated via a facile stripping and carbonization method from natural chitin for high-rate energy storage.

1604–1613

Multi-modal anti-counterfeiting and encryption enabled through silicon-based materials featuring pH-responsive fluorescence and room-temperature phosphorescence

Jinhua Wang, Bin Song, Jiali Tang, Guyue Hu, Jingyang Wang, Mingyue Cui, and Yao He*

Soochow University, China

A kind of silicon (Si)-based material, i.e., metal-organic frameworks (MOFs)-encapsulated Si nanoparticles (MOFs@SiNPs), is synthesized through microwave irradiation, which could exhibit pH-responsive fluorescence and room-temperature phosphorescence properties. We further demonstrate the resultant MOFs@SiNPs-based ink could offer multi-modal security, suitable for higher-level information security against counterfeiting.

1614–1619

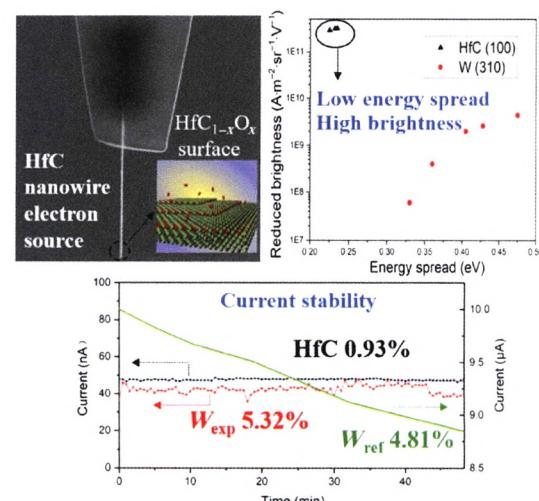

A HfC nanowire point electron source with oxycarbide surface of lower work function for high-brightness and stable field-emission

Shuai Tang¹, Jie Tang^{1,2,*}, Ta-wei Chiu^{1,2}, Wataru Hayami¹, Jun Uzuhashi¹, Tadakatsu Ohkubo¹, Fumihiko Uesugi¹, Masaki Takeguchi¹, Masanori Mitome¹, and Lu-Chang Qin^{3,*}

¹ National Institute for Materials Science, Japan

² University of Tsukuba, Japan

³ University of North Carolina at Chapel Hill, USA

By field evaporation and oxidation pretreatment, a single-crystalline HfC nanowire with an $\text{HfC}_{1-x}\text{O}_x$ surface layer on its tip apex has been fabricated and characterized as a field-emission point electron source. The new electron source has excellent electron optical properties of long-term current stability, high beam brightness, low energy spread, and lower operational vacuum.

1620–1626

High yield production of ultrathin fibroid semiconducting nanowire of $\text{Ta}_2\text{Pd}_3\text{Se}_8$
