Contents and Abstracts

STORAGE TECHNOLOGY

1 Technical Comparison and Analysis of Double - Layer Tank and Anti - Seepage Tank + Single - Layer Tank Process in Gas Station. Hou Qiang.

Abstract: The anti - seepage technology of the double - layer tank and the anti - seepage tank + the single - layer tank in the gas station are introduced in detail from the aspects of material and construction technology, and the anti - seepage technology of the double - layer tank and the anti - seepage tank + single - layer tank is compared and analyzed from the aspects of anti - seepage performance and construction cost, and the suggestions of using the anti - seepage technology of the double - layer tank as far as possible are put forward, which can provide a reference for the anti - seepage construction of the oil tank in the gas station.

Key words: gas station, double - layer tank, anti - seepage tank + single - layer tank, construction, comparison, analysis.

OIL AND GAS PIPELINE

4 Waste Oil Cleaning Treatment Technology for Guiyang—Chongqing Oil Product Pipeline. Shao Qi.

Abstract: The generation and pigging process of cleaning waste oil of Guiyang—Chongqing oil product pipeline is briefly described. On the basis of briefly introducing the thermal sedimentation method, centrifugal separation method, ultrasonic method and filtration method mainly used for pigging waste oil of oil product pipeline, the filtration method with the advantages of low cost, low energy consumption, simple process and relatively complete purification were emphasized. The working principle of the waste oil filtration device is introduced, and the problems existing in the operation of the filtration device are pointed out, such as the need for special personnel to be on duty, the high cost of replacing the filter element, the poor effect of the filtration method on emulsified oil, and the redundant connection of the device pipeline. Some improvement suggestions are put forward, viz., realizing the remote transmission function of data such as differential pressure, optimizing the process flow and the number of filter elements, integrating the treatment of emulsified oil, and improving the connection mode of inlet and outlet pipelines of the filtration device.

Key words: oil product, pipeline, pigging, waste oil, treatment, technology.

7 Cause Analysis and Control Measures of Excess Loss of an Oil Product Pipeline. Zhang Lei.

Abstract: The causes of excess loss of an oil product pipeline are analyzed. Firstly, the internal leakage of the valve leads to the empty pipe of the pipeline between

stations. Secondly, the uploaded data is inaccurate due to the mutual channeling of oil products between oil tanks in the uploaded oil depot. Thirdly, there is a large deviation between the automatic metering system and the manual ruler during the uploading and downloading of the oil depot. Fourthly, the error of the flowmeter is caused by the unreasonable installation position or mode, the readings variation of the flowmeter during shutdown caused by the micro flow of pipeline liquid, the zero drift of the flowmeter, medium temperature and pressure or other environmental factors. Therefore, corresponding control measures are put forward.

Key words: oil product, pipeline, transportation, excess loss, causes, analysis, countermeasures.

INFORMATION TECHNOLOGY

10 Research on Application of Digital Intelligence in Gas Stations Based on Video Recognition Technology. Gao Wang.

Abstract: In view of the problems in the traditional video monitoring system of the gas station that the customer information integrity needs to be improved, the response of the gas station needs to be strengthened, the convenience store management function needs to be improved, and the security warning needs to be developed, it is proposed to further play the equipment efficiency based on the existing video recognition technology, and expand the existing functions into streaming media collection, digital transformation, intelligent analysis, precision marketing, risk warning and other functions by using computer vision technology and business data analysis, to realize the improvement of customer information, intelligent marketing guide, improving management efficiency, reducing operational risk, and promoting the intelligent upgrading of gas stations from data collection, marketing analysis, efficient service, safety control and other aspects, so as to improve the level of business services, and promote the high-quality development of enterprises.

Key words: gas station, informatization, video recognition technology, expansion, digital intelligence technology, application, practice.

ENVIRONMENTAL PROTECTION

15 Emission and Control of Volatile Organic Compounds (VOCs) during Unloading at Gas Stations. Wang Lei.

Abstract: The reasons why the volatile organic compounds (VOCs) emissions exceed the standard in the unloading process of some gas stations are analyzed. Therefore, the improvement measures are proposed as follows: Firstly, a new type of inspector is installed and used to realize the whole process of airtight oil unloading in the gas station. Secondly, good airtightness of the oil vapor recovery system of the tanker should be ensured. Thirdly, the inspection of the airtightness of oil tank trucks and rubber hoses should be improved. Fourthly, oil unloading during high temperature period should be avoided.

Key words: gas station, oil unloading, volatile organic compounds (VOCs), emission, control.

QUANTITY AND QUALITY MANAGEMENT

18 Hazard Analysis and Suggestions on Governing Illegal Oil Products Based on Testing Practice. Huang

Junhan, Zeng Yongzhao, Chen Xianyin, Huang Yuyu, Yu Linhua.

Abstract: On the premise of briefly introducing the current situation of fighting against illegal activities in oil products market, a statistical analysis of the index data of the items related to the detection of motor gasoline and diesel seized in a place in Guangxi in the past three years is carried out, the harmfulness of fake and inferior oil products are pointed out, and the relevant suggestions for governing illegal oil products are put forward, such as increasing the publicity, strengthening the efforts to fighting activities and improve the effect of rectification, and improving the oil detection ability and improving the efficiency of governing illegal oil products.

Key words: oil product, market, rectification, fake and inferior, oil sample, detection, analysis, suggestions.

21 Study on the Detection Method of Nitrate Cetane Number Improvers in Three Diesel Fuels. Lu Yuanhua, Sun Guobin, Huang Zheng.

Abstract: According to Appendix B in the national standard "Automotive Diesel Fuel" (GB 19147 - 2016), the content of nitrate cetane number improver in diesel fuel was tested by infrared spectroscopy, chemiluminescence, and quinone compound indicator methods. The principles, methods, advantages and disadvantages, and detection precautions of the three detection methods were introduced respectively, providing a reference for laboratory determination of nitrate cetane number improver content in diesel fuel under different conditions.

Key words: diesel, nitrate, cetane number, improver, detection, method, research.

24 Evaluation of Uncertainty in Measurement of Cetane Number of Diesel Fuel by Air Volume Method. Cao Xingzhi.

Abstract: According to "Standard test method for determining cetane number of diesel fuel: Airflow regulation (GB/T 33298—2016)", using a special cetane number machine with airflow regulation, on the basis of accurately measuring the cetane number of diesel fuel, the standard uncertainty introduced in the repeated measurement of samples and the uncertainty introduced in the sub standard fuel configuration are analyzed and coupled into the total standard uncertainty. The experimental process, experimental conditions, main methods, sources and calculation models of uncertainty in the determination of cetane number of diesel fuel by airflow method are briefly introduced. The sources of uncertainty components introduced in the determination process are analyzed, calculated and evaluated, and the result of the determination of cetane number of diesel fuel by airflow method is 54.67 with the expanded uncertainty of 0.44. Some points for attention in the uncertainty experiment of diesel cetane number determination by airflow method are put forward.

Key words: airflow method, determination, diesel, cetane number, uncertainty, method, evaluation.

SAFETY MANAGEMENT

28 The Problems and Countermeasures of Intrinsic Safety of Petrochemical Enterprises. Jia Wenli

Abstract: On the basis of pointing out the problems existing in the intrinsic safety of petrochemical enter-

prises, such as lax management, weak “three basic” work, inadequate professional management, and poor risk management and control, the corresponding countermeasures to improve the intrinsic safety of petrochemical enterprises are put forward. In the aspect of improving the intrinsic safety of management, the first is to adhere to the sense of leadership to play the role of the leadership core to promote; the second is to adhere to the decomposition at all levels to effectively implement the post blame; the third is to adhere to the grid management, technical specialization, site standardization and behavior standardization to compact the safety responsibilities of all staff; the fourth is to adhere to double prevention to control risks throughout the process; the fifth is to adhere to prevention and control at the source to strictly control the risks of construction projects; the sixth is to adhere to strict management of cultivate high-quality contractors. In terms of improving the intrinsic safety of personnel, the first is to strengthen personnel and create a strong safety management line; the second is accurate training to improve personnel quality; the third is strict and meticulous management and control of personnel operation risk; the fourth is to adhere to the “135” treatment and strengthen the construction of emergency response capacity. In terms of intrinsic safety of lifting device: the first is the intrinsic safety of lifting equipment; the second is to strengthen the continuous compliance inspection and rectification; the third is strict and stable process management; and the fourth is to promote the construction of informatization, digitalization and intelligence.

Key words: petrochemical, enterprise, intrinsic safety, problems, countermeasures.

35 Application of Information Technology in “Three Basic” Management of Oil Sales Enterprises. Tan Fei.

Abstract: Taking SINOPEC Jiangxi Oil Product Company as an example, the importance of the “three basic” work of grass-roots construction, basic work and basic skill training in the safety management of petrochemical enterprises is introduced, and the problems existing in the “three basic” management in the safety management are pointed out that the grass-roots team construction cannot meet the needs of enterprise reform and development, the basic work cannot meet the needs of the operation of the enterprise HSE management system, and the basic skill training of employees cannot meet the needs of high-quality development of enterprises. The idea of improving the “three basic” management with information technology are put forward, such as promoting the implementation of the post responsibility system of all staff and strengthening the construction of grass-roots teams, promoting the implementation of grass-roots work and strengthening the construction of “three standards” at the grass-roots level, and promoting the implementation of basic skills training and strengthening the skills and literacy of grass-roots employees. The contents and effects of information technology to improve the “three bases” management are introduced in detail, such as carrying out safety management informatization to build a comprehensive HSE management evaluation system, deepening the HSE rating system to promote the implementation of the o-

verall responsibility system, establishing a risk early warning information system to strengthen the standardized operation of grass-roots on-site staff, increasing the use of equipment maintenance platform to improve the serviceability rate of equipment at the grass-roots level, and applying 3D simulation system to carry out skill training for employees.

Key words: oil sales enterprises, “three basic” management, safety management, problems, informatization, technology, application.

38 Discussion on Improving the Emergency Support Function of Integrated Energy Station. Shi Yonghui, He Wei.

Abstract: Through thinking about the role of the integrated energy station of SINOPEC Inner Mongolia Hohhot Oil Product Company in emergency support during the COVID-19, according to relevant laws and regulations such as the “Emergency Response Law” of the People’s Republic of China and relevant theories on accident causes, and on the basis of pointing out that the integrated energy station has a complete safety management system, natural geographical advantages and hardware conditions for emergency support, the possibility and plan of integrating the integrated energy station into the urban comprehensive disaster prevention system are put forward, viz., taking the initiative to integrate into the government emergency disaster prevention system to standardize the organizational behavior, improving the function of integrated energy station, improving the material allocation of the comprehensive energy station, giving full play to the role of contactless APP functions such as “one button refueling” and “one button to car”, and improving the emergency plan of the integrated energy station, which can provide a reference for the integrated energy station to be included in the urban emergency security system.

Key words: improvement, integration, energy station, emergency, guarantee, function, discussion.

OPERATION MANAGEMENT

41 Exploration and Practice of Adjustment and Optimization of the System of Oil Product Sales Enterprise. Fan Yue, Sun Meng.

Abstract: In view of the problems of a certain oil product sales enterprise, such as the untimely dynamic updating of the system, the obsolete and outdated provisions of some systems, the need to improve the standardization, integrity and progressiveness of the system, the division of the system by departments and blocks, the weak integration, and the untimely undertaking of the group company’s system, the optimization and adjustment of the system were carried out. The main approaches are as follows: The first is to set goals for problems; the second is to clarify the train of thought by comparing the objectives; the third is to establish institutions to promote implementation; the fourth is to take multiple measures and implement them in a standardized manner. Remarkable achievements have been made in the adjustment and optimization of enterprise systems, which can provide a reference for the adjustment and optimization of relevant enterprise systems.

Key words: oil sales enterprise, system, adjustment, optimization, exploration, practice.
