COVER

The cover image presents the structure-activity relationship of the oxygen evolution reaction (OER) by an atomic-scale cobalt-based nitrogen-carbon catalyst. In article No. 2207007, Wu *et al.* designed various Co-N-C configurations based on first-principles calculations to interpret the origin of the active site activity of OER electrocatalysts and predicted the theoretical lowest overpotential of 0.23 V by volcanic curves.
