COVER

The cover image shows the application of a sequential blade-coating deposition strategy for preparing large-area perovskite thin films.

In article No. 2203048, Wen *et al.* demonstrated that high-quality perovskite films can be obtained without residual unreacted lead iodide by incorporating tetrahydrothiophene 1-oxide into the lead iodide precursor solution to control the microstructure of the blade-coated lead iodide films.

To solve the problems of weak interface bonding forces in metallized polymer CCs and weak electrolyte compatibility, herein, a nano oxide strengthening layer is introduced between the polymer substrate and the metal aluminum layer. By enhancing interface mechanical interlocking and chemical bonding, the bonding force between the PET substrate and metal aluminum layer was increased, which enhances electrolyte compatibility. These findings provide theoretical and technical guidance for the development and application-scope expansion of composite CCs.
