Cover: Treatment with mesenchymal stem cells (MSCs) can improve the outcomes of COVID-19 patients by restoring a harmonious homeostasis of the immune microenvironment disrupted by SARS-CoV-2 attack and promoting the immune system recovery. This process suggests a new interpretation to the story of “Moses divided the Red Sea” in the Exodus of the Bible: MSC therapy represents a promising new way in the treatment of COVID-19. See page 1244-1262 by Rongjia Zhu et al. for details.

Schematic model of the evolutionarily conserved zipper head mechanism in telomerase. See page 1275-1290 by Futang Wan et al. for details.

Immunohistochemistry staining of p-S166 RIPK1 in the lungs of a COVID-19 patient. See page 1230-1243 by Gang Xu et al. for details.
